

End-to-End QA Audit&System Verification Report

LC Monitor — Workforce Management Platform

Project Name: LC Monitor (Workforce Management Platform)

Environment / URL: farhan.careerjumpstart.com.au

Test Type: Manual System Verification

Date of Execution: August 27, 2026

1. Executive Summary

I carried out a comprehensive manual QA audit of the LC Monitor platform ahead of its rollout to the wider employee base for active training and daily operational use. My objective was to validate core functionality, user workflows, data ingestion mechanics, visual layout integrity, and administrative controls prior to sign-off.

I tested both the Employee Portal and the Admin User Portal, covering User Management, Session&Workday Tracking, Attendance&Correction Workflows, Shift Scheduling, Department Assignments, System Analytics, Audit Logging, Network Rules (Trusted IPs), Email Configurations, and Employee Activity Tracking (browser history and automated screenshots).

Overall, the platform architecture, navigation, layout scaffolding, and basic administrative forms performed as expected. However, I identified critical defects in data ingestion (activity tracking and screenshots) and automated background session management, along with several UI/UX formatting anomalies that need to be resolved before handover.

2. Comprehensive Test Execution Matrix

Module / Feature	Scope Tested	Status	Key Observations
Authentication&Session	System login, active session retention, token persistence	FAIL	High severity: intermittent unexpected logouts during active use
Admin Dashboard	High-level metrics aggregation (Total Users, Working Now, Teams)	PASS	System metrics aggregate properly across administrative views.
Workday&Timesheet	Clock-in/out timers, session logs, break tracking, IP logging, notes	PASS	Session logs and character counter (0/2000) function as expected.
Attendance&Calendar	Visual calendar grid, attendance status counters	PASS	Grid renders correctly; metric totals update with recorded entries.
Attendance Corrections	Review list for employee clock-in/out adjustment requests	FAIL	Submissions render, but Approve/Reject action buttons are missing.

Module / Feature	Scope Tested	Status	Key Observations
Leave Management	Employee leave submission form, admin approval list	PASS / WARN	Approvals process correctly. Date formats alternate (08/27/2026 vs 2026-08-30).
Reports Module	Custom date filtering, session aggregation, status flags	PASS	Filtering and session count summaries aggregate accurately.
Policies Module	HR policy creation, content editor, publication engine	PASS / WARN	Publishing works. Typo in title: "attedance policy".
Browser History Tracking	Active browsing time, domain counting, tab duration	FAIL	0s recorded time and 0 domains captured during an active 1-hour session.
Automated Screenshots	15-minute periodic screen capture engine	FAIL	0 screenshots captured or synced during an active 1-hour session.
User Management	Create accounts, view user lists, assign roles/departments	PASS / WARN	Grid loads correctly. Names/titles render in lowercase.
Shift Scheduling	Create shifts, assign shifts, shift list mapping	PASS / WARN	Discrepancy between 12-hour input and 24-hour display.
Departments	Create, rename, and assign departments	PASS	Creation and list rendering function cleanly.
Analytics Module	Aggregate metric cards and charts	FAIL	AVG HOURS / DAY calculates to 43.2h — mathematical logic bug.
Audit Logs	System event logs, metadata, date filters	PASS	Logs events accurately with complete JSON metadata and IP addresses.
Trusted IPs	Office CIDR network configuration	PASS	CIDR form and configuration settings render correctly.
Email Notifications	System email triggers, delivery status, test sender	PASS / WARN	Status lists correctly. Sender shows unconfigured placeholder address.
Theme System	Light / Dark mode toggle	FAIL	Main canvas switches modes, but left sidebar stays permanently dark.
Global UI Header	Top breadcrumb text	FAIL	Light font weight creates low visual contrast against

Module / Feature	Scope Tested	Status	Key Observations
			light background.

3. Detailed Itemized Bug Register

3.1 High / Critical Severity Defects (Functional&Data Ingestion Failures)

BUG-01: Activity Ingestion Failure — Automated Screenshot Engine

Module: Monitoring / Screenshots (/admin/screenshots)

Description: During my verification test, I remained logged in and actively navigating the platform for a full 1-hour session as fareeha zareen. Despite system documentation stating screenshots are captured automatically every 15 minutes, no screenshots were recorded or synced to the Admin panel ("No screenshots found").

Impact: High — prevents administrators from auditing active employee work sessions.

Expected Behavior: The admin view should render approximately 3 to 4 captured screen snapshots for a 1-hour active session.

BUG-02: Activity Ingestion Failure — Browser History Tracking Engine

Module: Monitoring / Browser History (/admin/browser-history)

Description: During the same 1-hour active test session, I generated web browsing activity. However, the Admin panel logged 0s active browsing time and 0 unique domains for 08/27/2026.

Impact: High — core monitoring feature fails to track active browser metrics.

Expected Behavior: Active tab durations, domain counts, and top-visited URLs should log and aggregate in real time under the selected employee profile.

BUG-03: Intermittent Unhandled Session Logout

Module: Authentication&Session Management

Description: I observed active user sessions being terminated unexpectedly without warning, redirecting me to the login screen (occurred approximately 2 times within one hour of testing). Timers resumed correctly in the background after logging back in.

Impact: High — disrupts continuous workflow and operational tracking.

Expected Behavior: Active user sessions should remain persistent; silent background token refreshing should occur without abruptly logging the user out.

BUG-04: Incorrect Mathematical Aggregation in Analytics (AVG HOURS / DAY)

Module: Administration / Analytics (/admin/analytics)

Description: The analytics card displayed an average of 43.2h under AVG HOURS / DAY.

Impact: High — severe data inaccuracy in executive reporting dashboards.

Expected Behavior: Daily averages cannot exceed 24 hours per day. The underlying aggregation formula must divide total logged hours strictly by valid active days per user.

3.2 Medium Severity Defects (Workflow&UX Roadblocks)

BUG-05: Missing Action Controls on Attendance Correction Requests

Module: Attendance / Review Correction Requests

Description: Pending employee correction requests appear in the review table, but I found no interactive Approve or Reject action buttons for administrators to act on them.

Impact: Medium — leaves correction workflows stalled in a read-only state.

BUG-06: Placeholder Email Address in System Configuration

Module: Administration / Email Notifications (/admin/email)

Description: System email notification settings display a placeholder default sender (From: LC Monitor<heth.t@example.com>).

Impact: Medium — outbound notifications (leave updates, welcome emails) will fail delivery or be marked as spam.

3.3 Low Severity Defects (UI Layout, Visuals&Typography)

BUG-07: Incomplete Theme Inversion on Navigation Sidebar

Module: UI Framework / Global Layout

Description: Toggling between Light Mode and Dark Mode inverts the main content canvas, but the left vertical sidebar remains permanently locked in Dark Mode.

Impact: Low — visual inconsistency across the interface.

BUG-08: Low Contrast Global Header Subtext

Module: Visual Accessibility / Global Header

Description: The top header label "EMPLOYEE TIME&ATTENDANCE" uses a very thin font weight, making it difficult to read on standard desktop displays.

BUG-09: Uncapitalized User Names and Job Titles Across UI

Module: UI Copy / System-wide

Description: User full names and titles render entirely in lowercase across system greetings, dropdown menus, user management lists, and shift mappings (e.g., "fareeha zareen", "seo consultant", "sam sam").

Impact: Low — aesthetic defect; should automatically apply Title Case formatting (e.g., Fareeha Zareen, SEO Consultant).

BUG-10: Time&Date Format Inconsistencies Across Admin Views

Module: UI Data Formatting / Multi-Module

Description: Dates: input controls use MM/DD/YYYY (e.g., 08/27/2026), while table listings display YYYY-MM-DD (e.g., 2026-08-30). Shifts: the creation form uses 12-hour format with AM/PM pickers (09:00 AM, 06:00 PM), but table lists save values in 24-hour format without labels (01:00, 09:00, 18:00).

4. Technical Recommendations Prior to Software Rollout

- Verify ingestion architecture: ensure the browser tracking extension or background client/desktop app required for screenshot and URL capturing is properly bound, authenticated, and granted the required OS/browser permissions during session startup.
- Standardize data formats: implement global helpers across the frontend codebase to strictly format dates (DD/MM/YYYY or YYYY-MM-DD), times (consistent 12-hour vs. 24-hour display), and text capitalization (Title Case for user names and designations).
- Refactor session management: adjust active session token refresh intervals to prevent unhandled auto-logout during continuous system use.
